## Question 3 - Planar Homographies

### 3.0 - SIFT

Figure 1: Descriptor Points on Chickenbroth Model and Counter Images

### 3.1 - Finding Corresponding Points Using SIFT

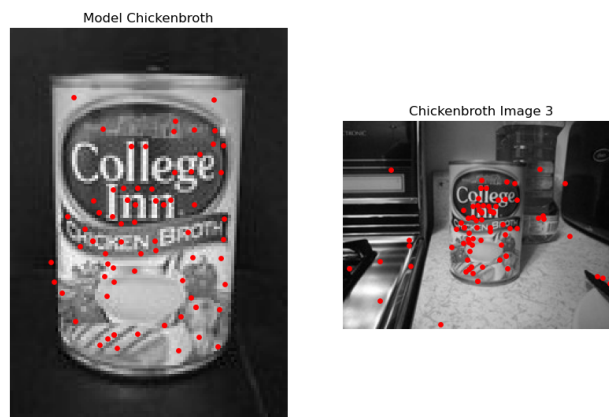

Figure 2: Corresponding Points on Chickenbroth Model and Counter Images

### 3.2 - Calculating Transformation

The implemented function to find the homography matrix performs the following steps:

1. From given points, constructs the  $A$  matrix as seen in lecture. For each point, two rows are defined:

$$A = \begin{bmatrix} -x & -y & -1 & 0 & 0 & 0 & x'x & x'y & x' \\ 0 & 0 & 0 & -x & -y & -1 & y'x & y'y & y' \end{bmatrix}$$

2. Calculate the SVD decomposition of  $A$ .
3. Find the minimal singular value and its corresponding column in  $V$ .
4. Reshape the column to a  $3 \times 3$  matrix  $H$  and return it.

The result is projected using the matrix, returned to heterogeneous coordinates and displayed in the image. The result is shown in Figure 3.
